AN EXPANSION FOR POLYNOMIALS ORTHOGONAL OVER AN ANALYTIC JORDAN CURVE

ERWIN MIÑA-DÍAZ

Abstract. We consider polynomials that are orthogonal over an analytic Jordan curve L with respect to a positive analytic weight, and show that each such polynomial of sufficiently large degree can be expanded in a series of certain integral transforms that converges uniformly in the whole complex plane. This expansion yields, in particular and simultaneously, Szegő's classical strong asymptotic formula and a new integral representation for the polynomials inside L. We further exploit such a representation to derive finer asymptotic results for weights having finitely many singularities (all of algebraic type) on a thin neighborhood of the orthogonality curve. Our results are a generalization of those previously obtained in [7] for the case of L being the unit circle.

1. Introduction and statements of the results

The study of polynomials orthogonal over a closed rectifiable curve of the complex plane was initiated by Szegő in [20], and later continued by Szegő himself and such authors as Smirnov, Keldysh, Lavrentiev, Korovkin, Suetin and Geronimous (see [17] for references and an overview of the developments until 1964). Polynomials orthogonal over several arcs and curves have also been studied, for instance (and without being exhaustive), by Akhiezer [1], [2], Widom [21], Aptekarev [3], Peherstorfer and coauthors [9], [10], [11], [12], [13], and for an orthogonality measure with finitely many point masses outside the curve/arc, by Kaliaguine [5], [6].

Among the central questions that are often investigated figure the asymptotic behavior of the orthogonal polynomials and the distribution and location of their zeros. In this regard, the case of a closed curve has the peculiarity (not observed in that of an open arc) that the interior of its polynomial convex hull is non-empty[1], giving more freedom of distribution to the zeros of the polynomials, and consequently, making the behavior of the polynomials themselves much less clear. The results of the present work clarify this question to a substantial extent for a single closed curve under analyticity conditions.

Let L_1 be an analytic Jordan curve in the complex plane $\mathbb{C}$ and let $h(z)$ be an analytic function in a neighborhood of L_1 such that $h(z) > 0$ for all $z \in L_1$. Using the Gram-Schmidt orthogonalization process, we can form a unique sequence $\{p_n(z)\}_{n=0}^{\infty}$ of orthonormal polynomials over L_1 with respect to $h(z)$, i.e., satisfying

$$p_n(z) = \gamma_n z^n + \text{lower degree terms}, \quad \gamma_n > 0, \quad n \geq 0, \tag{1}$$

$$\frac{1}{2\pi}\oint_{L_1} p_n(z)\overline{p_m(z)}h(z)|dz| = \begin{cases} 0, & n \neq m, \\ 1, & n = m. \end{cases} \tag{2}$$

In what follows, we are concerned with the asymptotic behavior of these polynomials as their degree n becomes large. With this generality, essentially the only known result is Szegő's strong asymptotic formula

$$p_n(z) = \Delta_e(z;h)\sqrt{\phi'(z)}[\phi(z)]^n\,[1 + o(1)]\,. \tag{3}$$

Here ϕ is the conformal map of the exterior Ω_1 of L_1 onto the exterior of the unit circle satisfying that $\phi(\infty) = \infty$, $\phi'(\infty) > 0$, $\Delta_e(z;h)$ is the so-called exterior Szegő function for the weight h, and (3) holds locally uniformly as $n \to \infty$ on any open set $\Omega_\rho \supset \overline{\Omega}_1$ that is conformally mapped by ϕ onto the exterior of a circle about the origin of radius $\rho < 1$, and is such that $\Delta_e(z;h)$ is analytic on Ω_ρ (see next subsection for details).

---

[1] A well-known result by Widom [22] asserts that the zeros must accumulate, in the limit, on the polynomial convex hull of the support of the orthogonality measure.

For $h(z) \equiv 1$, this formula was established by Szegő in his paper [20] of 1921, while for an arbitrary positive analytic weight, it first appears in Chap. XVI of the first edition of his book [19] of 1939. So far as this writer can learn, progress in understanding the asymptotic behavior of $p_n(z)$ at the remaining points of the complex plane, that is, for $z \in \mathbb{C} \setminus \Omega_\rho$, has only been made in the specific case of L_1 being the unit circle, the strongest result having being obtained recently in [7]. Here the authors use the Riemann-Hilbert approach for the asymptotic analysis of orthogonal polynomials to derive, for each $p_n(z)$ of sufficiently large degree, a series expansion in terms of certain recursively generated Cauchy transforms. This important result yields at once Szegő's asymptotic formula and an integral representation for $p_n(z)$ inside the unit circle, from which it is possible to distill the precise behavior of the polynomials under additional assumptions on the first singularities encountered by the exterior Szegő function. This has been done in [7] for finitely many polar singularities, as well as for two examples of an isolated essential singularity. Earlier related works (e.g., [18]) are briefly described in the introduction of [7].

In the present paper we extend the expansion of [7] to an arbitrary analytic curve. Our proof is not based on the Riemann-Hilbert method, it is rather direct and in some sense natural, which we believe will lead to applications to other systems of orthogonal polynomials. From the dominant term of the expansion we derive precise asymptotic formulas for $p_n(z)$ in a case where the exterior Szegő function has finitely many algebraic singularities in a thin neighborhood of L_1. We state our results in Subsections 1.2 and 1.3 below, followed by their proofs in Section 2.

1.1. **Preliminaries.**

In this subsection we introduce some notation to be used throughout, as well as the concepts involved in the asymptotic behavior of p_n. In particular, we discuss the Szegő functions associated with the weight h. For a deeper discussion of these functions we refer the reader to Chap. X of [19].

Given $r \geq 0$, we set

$$\mathbb{T}_r := \{w : |w| = r\}, \quad \mathbb{E}_r := \{w : r < |w| \leq \infty\}, \quad \mathbb{D}_r := \{w : |w| < r\}.$$

If K is a set and $f(z)$ a function defined on K, then $\overline{K}$ and ∂K denote, respectively, the closure and the boundary of K, and $f(K) := \{f(z) : z \in K\}$.

Szegő functions. Let $f(t)$ be an analytic function defined on a neighborhood of the unit circle $\mathbb{T}_1$ such that $f(t) > 0$ for all $t \in \mathbb{T}_1$. The function

$$w \mapsto \exp\left\{\frac{1}{4\pi}\oint_{\mathbb{T}_1} \log f(t)\frac{t+w}{t-w}|dt|\right\} = \exp\left\{\frac{1}{4\pi i}\oint_{\mathbb{T}_1} \frac{\log f(t)}{t}\cdot\frac{t+w}{t-w}dt\right\}, \quad w \in \overline{\mathbb{C}} \setminus \mathbb{T}_1, \tag{4}$$

is analytic on $\overline{\mathbb{C}} \setminus \mathbb{T}_1$. Its restriction to $\mathbb{D}_1$ is called the *interior* Szegő function for f, and we denote it by $D_i(w; f)$. It is univocally determined by the properties

(a) $D_i(w; f)$ has an analytic continuation from $\mathbb{D}_1$ to some neighborhood of $\overline{\mathbb{D}}_1$, $D_i(w; f) \neq 0$ for all $w \in \overline{\mathbb{D}}_1$ and $D_i(0; f) > 0$;
(b) $|D_i(w; f)|^2 = f(w)$ for all $w \in \mathbb{T}_1$.

Property (a) easily follows by noticing that $\log f(t)$ is analytic in a neighborhood of $\mathbb{T}_1$, and therefore, the analytic continuation of $D_i(w; f)$ to $\overline{\mathbb{D}}_1$ is given by the expression to the right of the $=$ sign in (4) if integration is taken over a circle about the origin of radius slightly larger that 1. Property (b) is a consequence of that $|D_i(w; f)|^2$ is the exponential of the Poisson integral of $\log f(t)$ (see, e.g., [14, Thm. 11.8]).

The restriction of the function in (4) to $\mathbb{E}_1$ is called the *exterior* Szegő function for f and we denote it by $D_e(w; f)$. Notice that

$$D_e(w; f) = \frac{1}{\overline{D_i(1/\overline{w}\,; f)}}, \quad w \in \mathbb{E}_1,$$

so that $D_e(w; f)$ is univocally determined by the properties

(a′) $D_e(w; f)$ has an analytic continuation from $\mathbb{E}_1$ to some neighborhood of $\overline{\mathbb{E}}_1$; $D_e(w; f) \neq 0$ for all $z \in \overline{\mathbb{E}}_1$ and $D_e(\infty; f) > 0$;
(b′) $|D_e(w; f)|^{-2} = f(w)$ for all $w \in \mathbb{T}_1$.

These considerations can be generalized to an arbitrary analytic Jordan curve L_1 as follows. Let Ω_1 be the exterior of L_1, that is, the unbounded component of $\overline{\mathbb{C}} \setminus L_1$, and let $\psi = \psi(w)$ be the unique conformal map of $\mathbb{E}_1$ onto Ω_1 satisfying that $\psi(\infty) = \infty$, $\psi'(\infty) > 0$.

Let $\widehat{\rho} \geq 0$ be the smallest number such that ψ has an analytic and *univalent* continuation from $\mathbb{E}_1$ to $\mathbb{E}_{\widehat{\rho}}$. Because L_1 is analytic, $\widehat{\rho} < 1$.

For every r with $\widehat{\rho} \leq r < \infty$, set

$$\Omega_r := \psi(\mathbb{E}_r), \quad L_r := \partial\Omega_r, \quad G_r := \mathbb{C} \setminus \overline{\Omega}_r,$$

and let

$$\phi(z) : \Omega_{\widehat{\rho}} \mapsto \mathbb{E}_{\widehat{\rho}}$$

be the inverse function of ψ. Observe that for every $r > \widehat{\rho}$, L_r is an analytic Jordan curve.

Then, given a weight function $h(z)$ that is positive and analytic on L_1, the *exterior* Szegő function $\Delta_e(z; h)$ for h is defined as

$$\Delta_e(z; h) := D_e(\phi(z); h \circ \psi) = \exp\left\{ \frac{1}{4\pi i} \oint_{L_1} \log h(\zeta) \frac{1 + \overline{\phi(\zeta)}\phi(z)}{\phi(\zeta) - \phi(z)} \phi'(\zeta) d\zeta \right\}, \quad z \in \Omega_1,$$

which is uniquely determined by the properties

(i$'$) $\Delta_e(z; h)$ is analytic and never zero on $\overline{\Omega}_1$, $\Delta_e(\infty; h) > 0$;
(ii$'$) $|\Delta_e(z; h)|^{-2} = h(z)$ for all $z \in L_1$.

Similarly, any conformal map $\varphi(z)$ of the interior domain G_1 of L_1 onto the unit disk $\mathbb{D}_1$ has an analytic and univalent continuation to some neighborhood of $\overline{G}_1$. Denoting its inverse by $\delta(w) : \overline{\mathbb{D}}_1 \mapsto \overline{G}_1$, an *interior* Szegő function $\Delta_i(z; h)$ for h is defined as

$$\Delta_i(z; h) := D_i(\varphi(z); h \circ \delta) = \exp\left\{ \frac{1}{4\pi i} \oint_{L_1} \log h(\zeta) \frac{1 + \overline{\varphi(\zeta)}\varphi(z)}{\varphi(\zeta) - \varphi(z)} \varphi'(\zeta) d\zeta \right\}, \quad z \in G_1, \tag{5}$$

which satisfies the properties

(i) $\Delta_i(z; h)$ is analytic and never zero on $\overline{G}_1$;
(ii) $|\Delta_i(z; h)|^2 = h(z)$ for all $z \in L_1$.

Although the interior Szegő functions as defined by (5) depend on the choice of φ, any two of them differ at most in a multiplicative constant of modulus 1. Hereafter we shall assume that one such $\Delta_i(z; h)$ has been fixed.

Let ρ be the smallest number larger than or equal to $\widehat{\rho}$ such that $\Delta_e(z; h)$ is analytic on Ω_ρ. By property (i$'$), $\widehat{\rho} \leq \rho < 1$. Moreover,

(iii) $\Delta_i(z; h)^{-1}$ has an analytic continuation from $\overline{G}_1$ to $G_{1/\rho}$.

To see this, consider the Schwarz function $S(z)$ of the curve L_1 (see, e.g., [4]), which is analytic and univalent in a neighborhood of L_1, and is univocally determined by the property that $S(z) = \overline{z}$ for $z \in L_1$. Indeed, $S(z)$ is well-defined all over the band $\Omega_{\widehat{\rho}} \cap G_{1/\widehat{\rho}}$, where it can be expressed in terms of the exterior conformal maps as

$$S(z) = \overline{\psi\left(1/\overline{\phi(z)}\right)}, \quad z \in \Omega_{\widehat{\rho}} \cap G_{1/\widehat{\rho}}.$$

Let

$$z^* := \overline{S(z)}, \quad z \in \Omega_{\widehat{\rho}} \cap G_{1/\widehat{\rho}},$$

be the so-called Schwarz reflection of z about L_1. Then, the analytic continuation of $\Delta_i(z; h)^{-1}$ from $\overline{G}_1$ to $G_{1/\rho}$ is given by

$$\frac{1}{\Delta_i(z; h)} := \Delta_e(z; h)\overline{\Delta_e(z^*; h)\Delta_i(z^*; h)}, \quad z \in G_{1/\rho} \setminus \overline{G}_1.$$

The kernel $W(\zeta,z)$. Let φ denote, as above, a conformal map of G_1 onto $\mathbb{D}_1$, and define the meromorphic kernel

$$W(\zeta,z):=\frac{\sqrt{\varphi'(z)}\sqrt{\varphi'(\zeta)}}{\varphi(\zeta)-\varphi(z)},\quad \zeta,\, z\in G_1. \tag{6}$$

That this kernel does not depend on the choice of φ can be easily verified from the fact that any other conformal map φ_1 of G_1 onto $\mathbb{D}_1$ is related to φ through a Möbius transformation, that is,

$$\varphi(z)=e^{i\theta}\frac{\varphi_1(z)-\varphi_1(z_0)}{1-\overline{\varphi_1(z_0)}\varphi_1(z)},\qquad e^{i\theta}=\varphi'(z_0)\left(1-|\varphi_1(z_0)|^2\right)/\varphi_1'(z_0),$$

where z_0 is that point of G_1 mapped by φ onto 0.

Moreover, if we choose, as we may, a conformal map φ that does not vanish on $\Omega_{\widehat{\rho}}\cap G_1$, then this φ has an analytic and univalent continuation from $\overline{G}_1$ to $G_{1/\widehat{\rho}}$ given by

$$\varphi(z)=\frac{1}{\overline{\varphi\left(z^*\right)}},\qquad z\in G_{1/\widehat{\rho}}\setminus\overline{G}_1,$$

so that $W(\zeta,z)$ can be extended as a function

$$W(\zeta,z): G_{1/\widehat{\rho}}\times G_{1/\widehat{\rho}}\to\overline{\mathbb{C}}$$

in such a way that for every fixed $z\in G_{1/\widehat{\rho}}$, $W(\zeta,z)$ is analytic in the variable ζ on $G_{1/\widehat{\rho}}\setminus\{z\}$, with a simple pole at z of residue 1.

We finish this subsection by noticing that positive analytic weights $h(z)$ over L_1 are easy to generate because they are precisely those of the form

$$h(z)=V(z)\overline{V(z^*)},\quad z\in L_1,$$

with $V(z)$ a zero free analytic function in a neighborhood of L_1.

1.2. **The expansions.** Hereafter we will suppress h and simply write $\Delta_e(z)$ for $\Delta_e(z;h)$ and $\Delta_i(z)$ for $\Delta_i(z;h)$.

Fix a number r such that $\rho<r<1$, and for each integer $n\geq 0$, let us recursively define the following sequence of functions:

$$f_n^{(0)}(z):=1,\quad z\in\overline{\mathbb{C}},$$

and for all $k\geq 0$,

$$f_n^{(2k+1)}(z):=-\frac{1}{2\pi i}\oint_{L_r}f_n^{(2k)}(\zeta)\Delta_e(\zeta)\Delta_i(\zeta)W(\zeta,z)\sqrt{\phi'(\zeta)}\,[\phi(\zeta)]^n d\zeta,\quad z\in G_{1/\rho}\setminus L_r,$$

$$f_n^{(2k+2)}(z):=\frac{1}{2\pi i}\oint_{L_{1/r}}\frac{f_n^{(2k+1)}(\zeta)\sqrt{\phi'(\zeta)}\,[\phi(\zeta)]^{-n}d\zeta}{\Delta_e(\zeta)\Delta_i(\zeta)[\phi(\zeta)-\phi(z)]},\quad z\in\Omega_\rho\setminus L_{1/r}.$$

Let

$$\Lambda_r:=\max_{\zeta\in L_r}\left|\frac{\Delta_e(\zeta)\Delta_i(\zeta)}{\sqrt{\phi'(\zeta)}}\right|,\qquad \Lambda_r':=\max_{\zeta\in L_{1/r}}\left|\sqrt{\phi'(\zeta)}\Delta_e(\zeta)\Delta_i(\zeta)\right|^{-1},$$

and

$$M_r:=\max_{(\zeta,z)\in L_r\times L_{1/r}}|W(\zeta,z)|<\infty,$$

so that obviously (verify it by mathematical induction), for all $k\geq 0$,

$$\left|f_n^{(2k+1)}(z)\right|\leq\Lambda_r r^{n+1}\left[\frac{\Lambda_r\Lambda_r'M_r r^{2n}}{1/r-r}\right]^k\max_{\zeta\in L_r}|W(\zeta,z)|,\quad z\in G_{1/\rho}\setminus L_r,\quad k\geq 0, \tag{7}$$

$$\left|f_n^{(2k+2)}(z)\right|\leq\frac{\Lambda_r\Lambda_r'M_r r^{2n}}{|1/r-|\phi(z)||}\left[\frac{\Lambda_r\Lambda_r'M_r r^{2n}}{1/r-r}\right]^k,\quad z\in\Omega_\rho\setminus L_{1/r},\quad k\geq 0. \tag{8}$$

It follows that the two series

$$f_n^{(0)}(z)+f_n^{(2)}(z)+f_n^{(4)}(z)+\cdots+f_n^{(2k)}(z)+\cdots,\quad z\in\Omega_\rho\setminus L_{1/r},$$

$$f_n^{(1)}(z)+f_n^{(3)}(z)+\cdots+f_n^{(2k+1)}(z)+\cdots,\quad z\in G_{1/\rho}\setminus L_r,$$

converge absolutely and locally uniformly in their respective regions of definition, provided n is so large that

$$\frac{\Lambda_r \Lambda_r' M_r r^{2n}}{1/r - r} < 1. \tag{9}$$

Let $P_n(z)$ be the nth monic orthogonal polynomial, that is,

$$P_n(z) = \gamma_n^{-1} p_n(z), \quad n \geq 0,$$

where p_n satisfies (1) and (2).

Theorem 1.1. *For every n satisfying (9), we have*

$$\frac{\Delta_e(\infty) P_n(z)}{[\phi'(\infty)]^{-n-1/2}} = \begin{cases} \Delta_e(z)\sqrt{\phi'(z)}\,[\phi(z)]^n \displaystyle\sum_{k=0}^{\infty} f_n^{(2k)}(z), & z \in \Omega_{1/r}, \\ \Delta_e(z)\sqrt{\phi'(z)}\,[\phi(z)]^n \displaystyle\sum_{k=0}^{\infty} f_n^{(2k)}(z) - \frac{1}{\Delta_i(z)} \sum_{k=0}^{\infty} f_n^{(2k+1)}(z), & z \in \Omega_r \cap G_{1/r}\,, \\ -\dfrac{1}{\Delta_i(z)} \displaystyle\sum_{k=0}^{\infty} f_n^{(2k+1)}(z), & z \in G_r, \end{cases} \tag{10}$$

and

$$\gamma_n^{-2} = \Delta_e(\infty)^{-2}[\phi'(\infty)]^{-2n-1} \left(1 + \sum_{k=0}^{\infty} \frac{1}{2\pi i} \oint_{L_{1/r}} \frac{f_n^{(2k+1)}(\zeta)\sqrt{\phi'(\zeta)}\,[\phi(\zeta)]^{-n-1} d\zeta}{\Delta_e(\zeta)\Delta_i(\zeta)} \right). \tag{11}$$

Let us now consider the following slightly different sequence of integral transforms. For each fixed integer $n \geq 0$, set

$$g_n^{(0)}(z) := 1, \quad z \in \overline{\mathbb{C}},$$

and for all $k \geq 0$,

$$\begin{aligned} g_n^{(2k+1)}(z) &:= -\frac{1}{2\pi i} \oint_{L_r} g_n^{(2k)}(\zeta) \Delta_e(\zeta) \Delta_i(\zeta) W(\zeta, z) \sqrt{\phi'(\zeta)}\,[\phi(\zeta)]^n d\zeta, \quad z \in G_{1/\rho} \setminus L_r, \\ g_n^{(2k+2)}(z) &:= \frac{\phi(z)}{2\pi i} \oint_{L_{1/r}} \frac{g_n^{(2k+1)}(\zeta)\sqrt{\phi'(\zeta)}\,[\phi(\zeta)]^{-n-1} d\zeta}{\Delta_e(\zeta)\Delta_i(\zeta)[\phi(\zeta) - \phi(z)]}, \quad z \in \Omega_\rho \setminus L_{1/r}. \end{aligned}$$

Then,

$$\left| g_n^{(2k+1)}(z) \right| \leq \Lambda_r r^{n+1} \left[\frac{\Lambda_r \Lambda_r' M_r r^{2n+2}}{1/r - r} \right]^k \max_{\zeta \in L_r} |W(\zeta, z)|, \quad z \in G_{1/\rho} \setminus L_r, \quad k \geq 0,$$

$$\left| g_n^{(2k+2)}(z) \right| \leq \frac{|\phi(z)| \Lambda_r \Lambda_r' M_r r^{2n+1}}{|1/r - |\phi(z)||} \left[\frac{\Lambda_r \Lambda_r' M_r r^{2n+2}}{1/r - r} \right]^k, \quad z \in \Omega_\rho \setminus L_{1/r}, \quad k \geq 0,$$

and the following theorem holds true:

Theorem 1.2. *For every n satisfying (9), we have*

$$\frac{\gamma_n^2 P_n(z)}{\Delta_e(\infty)[\phi'(\infty)]^{n+1/2}} = \begin{cases} \Delta_e(z)\sqrt{\phi'(z)}\,[\phi(z)]^n \displaystyle\sum_{k=0}^{\infty} g_n^{(2k)}(z), & z \in \Omega_{1/r}, \\ \Delta_e(z)\sqrt{\phi'(z)}\,[\phi(z)]^n \displaystyle\sum_{k=0}^{\infty} g_n^{(2k)}(z) - \frac{1}{\Delta_i(z)} \sum_{k=0}^{\infty} g_n^{(2k+1)}(z), & z \in \Omega_r \cap G_{1/r}, \\ -\dfrac{1}{\Delta_i(z)} \displaystyle\sum_{k=0}^{\infty} g_n^{(2k+1)}(z), & z \in G_r. \end{cases}$$

In particular,

$$\gamma_n^2 = \Delta_e(\infty)^2 [\phi'(\infty)]^{2n+1} \sum_{k=0}^{\infty} g_n^{(2k)}(\infty). \tag{12}$$

Remark 1.3. *These expansions have been previously obtained in* [7] *for $L_1 = \mathbb{T}_1$. They are the outcome of applying the steepest descent method of Deift and Zhou for the asymptotic analysis of a matrix Riemann-Hilbert problem solved by the orthogonal polynomials and closely related functions. Theorem 1.1 extends Theorem 1 of* [7]*, while relation (12) extends Theorem 2 of* [7]*. Our proof of Theorem 1.1 (and similarly, that of Theorem 1.2) is direct: call $H_n(z)$ the function in the right-hand side of (10) and observe that the three expressions that define it in the corresponding components of $\overline{\mathbb{C}} \setminus \left(L_r \cup L_{1/r}\right)$ are redundant, in the sense that they are analytic continuations of each other. Thus, $H_n(z)$ is an entire function with a pole of order n at ∞, therefore it is a polynomial. Proving that it is orthogonal to all powers of z^m, $0 \le m < n$, is also straightforward.*

Corollary 1.4. *Let r_1 be such that $\rho < r_1 < 1/\rho$. Then for every $r > \rho$,*

$$\gamma_n = \Delta_e(\infty)[\phi'(\infty)]^{n+1/2}\left\{1 + \mathcal{O}\left(r^{2n}\right)\right\}, \tag{13}$$

$$P_n(z) = \frac{\Delta_e(z)\sqrt{\phi'(z)}\,[\phi(z)]^n}{\Delta_e(\infty)[\phi'(\infty)]^{n+1/2}}\left\{1 + \mathcal{O}\left(\frac{r^n}{r_1^n}\right)\right\}, \quad z \in \overline{\Omega}_{r_1}. \tag{14}$$

If $\rho < r_1 < 1$, then

$$\frac{\Delta_e(\infty)P_n(z)}{[\phi'(\infty)]^{-n-1/2}} = \frac{\Delta_i(z)^{-1}}{2\pi i}\oint_{L_1}\Delta_e(\zeta)\Delta_i(\zeta)W(\zeta,z)\sqrt{\phi'(\zeta)}\,[\phi(\zeta)]^n d\zeta + \mathcal{O}\left(r_1^n r^{2n}\right), \quad z \in \overline{G}_{r_1}. \tag{15}$$

Equalities (14) and (15) hold uniformly as $n \to \infty$.

Of course, (13) and (14) are equivalent to

$$p_n(z) = \Delta_e(z)\sqrt{\phi'(z)}\,[\phi(z)]^n\left\{1 + \mathcal{O}\left(\frac{r^n}{r_1^n}\right)\right\}, \quad z \in \overline{\Omega}_{r_1}. \tag{16}$$

Formula (16) is due to Szegő [19, Thm. 16.5], though he established it with a less precise estimate for the rate of decay of the error term. For $\rho < r_1 \le 1$, the estimate in (16) was already obtained by Suetin in [17] (see formula (2.16) in there).

1.3. Positive weights with algebraic singularities near L_1.

We can derive from (15) finer asymptotic formulas for P_n if we know more about the singularities of both the exterior Szegő function and the map ψ. For instance, if $h(z) \equiv 1$, then $\Delta_e(z) \equiv 1$, $\Delta_i(z) \equiv 1$, and the behavior of P_n inside L_1 only depends on geometric considerations and can be determined with great precision, for instance, when $\partial\Omega_{\widehat{\rho}}$ is a piecewise analytic curve, in which case the map ψ has finitely many singularities on the circle $\mathbb{T}_{\widehat{\rho}}$, having an asymptotic expansion about each of them. We will not pursue the analysis of this case here as it is very similar to the one already carried out in [8] for polynomials orthogonal over the interior of an analytic curve with respect to area measure. Instead, we shall concentrate on a case where the behavior of P_n is only influenced by the singularities of $\Delta_e(z)$, which are finitely many, all lying on the band $G_1 \cap \Omega_{\widehat{\rho}}$ and of algebraic type.

Let $a_1, a_2, \ldots, a_s$ be $s \ge 1$ distinct complex numbers all lying on a curve L_ρ with $\widehat{\rho} < \rho < 1$. Let $\lambda_1 \ge \lambda_2 \ge \cdots \ge \lambda_s$ be such that $\lambda_k \in \mathbb{R} \setminus \{0, -1, -2, \ldots\}$ for all $1 \le k \le s$, and let u be the number of subindexes k for which $\lambda_k = \lambda_1$, so that

$$\lambda_1 = \lambda_2 = \cdots = \lambda_u > \lambda_{u+1} \ge \cdots \ge \lambda_s \quad (1 \le u \le s).$$

Consider a weight of the form

$$h(z) := |\omega(z)|^{-2}\prod_{k=1}^{s}|z - a_k|^{2\lambda_k}, \quad z \in L_1, \tag{17}$$

where $\omega(z)$ is an analytic function on $\overline{\Omega}_\sigma$ for some $\widehat{\rho} < \sigma < \rho$, positive at ∞ and never zero on $\overline{\Omega}_1 \cup \{a_1, a_2, \ldots, a_s\}$.

Let the numbers ρ_k, σ_k, Θ_k $(1 \le k \le s)$ be defined from the a_k's by the relations

$$\rho_k := \phi(a_k) = \rho e^{i\Theta_k}, \quad \sigma_k := \sigma e^{i\Theta_k}, \quad 0 \le \Theta_k < 2\pi, \quad 1 \le k \le s. \tag{18}$$

Let $[\sigma_k, \rho_k]$ be the segment joining σ_k and ρ_k, and define (see Figure 1 below)

$$\Gamma_\sigma := \mathbb{T}_\sigma \cup \{\rho_k : \lambda_k \in \mathbb{N}\} \cup \left(\cup_{\lambda_k \notin \mathbb{N}}[\sigma_k, \rho_k]\right), \quad \Sigma_\sigma := \{z \in \Omega_\sigma : \phi(z) \notin \Gamma_\sigma\}, \tag{19}$$

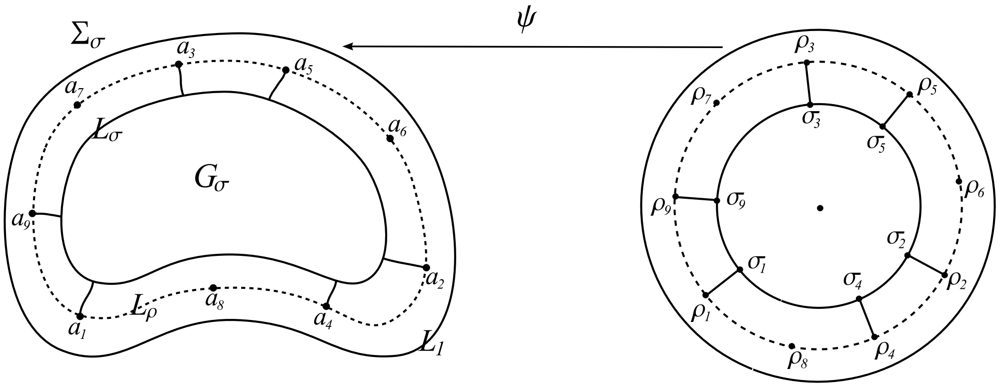

FIGURE 1. Illustration of 9 singularities, a_6, a_7 and a_8 are poles.

so that the exterior Szegő function for the weight h in (17) is analytic on Σ_σ with $a_1, a_2, \ldots, a_s$ being its only singularities on L_ρ, since, indeed,

$$\Delta_e(z) = \omega(z) \prod_{k=1}^{s} \left(\frac{\phi(z)}{z - a_k} \right)^{\lambda_k}, \quad z \in \Sigma_\sigma, \tag{20}$$

with the branches of the λ_k-power functions chosen so that $[\phi'(\infty)]^{\lambda_k} > 0$.

An interior Szegő function $\Delta_i(z)$ for h is given by

$$\Delta_i(z) = \Delta_i\left(z; |\omega|^{-2}\right) \prod_{k=1}^{s} \left(\frac{(z - a_k)\left[1 - \overline{\varphi(a_k)}\varphi(z)\right]}{\varphi(z) - \varphi(a_k)} \right)^{\lambda_k}, \quad z \in \overline{G}_1 . \tag{21}$$

In what follows,

$$\alpha_k := [\phi'(a_k)]^{\lambda_k - 1/2} \lim_{z \to a_k} \left\{ \left(\frac{\phi(z)}{z - a_k} \right)^{-\lambda_k} \Delta_e(z) \right\}, \quad 1 \le k \le s,$$

and $\binom{a}{b}$ stands for the generalized binomial coefficient, i.e.,

$$\binom{a}{b} := \frac{\Gamma(a+1)}{\Gamma(b+1)\Gamma(a-b+1)},$$

where Γ denotes the Euler gamma function.

Theorem 1.5. *(a) For all $z \in G_1 \setminus \partial\Sigma_\sigma$,*

$$\begin{aligned} \frac{\Delta_e(\infty) P_n(z)}{[\phi'(\infty)]^{-n-1/2}} &= \begin{cases} \Delta_e(z)\sqrt{\phi'(z)}[\phi(z)]^n, & z \in G_1 \cap \Sigma_\sigma, \\ 0, & z \in G_\sigma, \end{cases} \\ &\quad + \binom{n}{\lambda_1 - 1} \Delta_i(z)^{-1} \left(\sum_{k=1}^{u} \alpha_k \Delta_i(a_k) W(a_k, z) [\phi(a_k)]^{n+1} + \rho^n r_n(z) \right) \end{aligned} \tag{22}$$

where $r_n(z)$ converges locally uniformly to 0 on $G_1 \setminus \partial\Sigma_\sigma$.

(b) For every $1 \le j \le s$,

$$\begin{aligned} \frac{\Delta_e(\infty) P_n(a_j)}{[\phi'(\infty)]^{-n-1/2}} &= \binom{n}{\lambda_j} \alpha_j \phi'(a_j) \phi(a_j)^n + \binom{n}{\lambda_1 - 1} \Delta_i(a_j)^{-1} \sum_{1 \le k \le u,\, k \ne j} \alpha_k \Delta_i(a_k) W(a_k, a_j) [\phi(a_k)]^{n+1} \\ &\quad + o\left(n^{\max\{\lambda_j, \lambda_1 - 1\}} \rho^n \right) \end{aligned} \tag{23}$$

as $n \to \infty$.

Several remarks are in order.

Remark 1.6. *The proof of Theorem 1.5 yields the following estimates for the rate of decay of the functions* $r_n(z)$ *in (22). If* $\lambda_1 = 1$ *and* $u = s$*, then for every compact set* $K \subset G_1 \setminus \partial\Sigma_\sigma$*, there is* $0 < \delta < 1$ *such that* $r_n(z) = \mathcal{O}(\delta^n)$ *uniformly on* K *as* $n \to \infty$*. Otherwise,*

$$r_n(z) = \begin{cases} \mathcal{O}\left(n^{\lambda_{u+1}-\lambda_1}\right), & \text{if } \lambda_1 = 1,\ u < s, \\ \mathcal{O}\left(n^{-1}\right), & \text{if } \lambda_1 \neq 1,\ u = s, \\ \mathcal{O}\left(n^{-\min\{1,\,\lambda_1-\lambda_{u+1}\}}\right), & \text{if } \lambda_1 \neq 1,\ u < s, \end{cases}$$

locally uniformly on $G_1 \setminus \partial\Sigma_\sigma$ *as* $n \to \infty$*.*

Likewise, a better and generally exact estimate for the o-error term in (23) can be easily obtained from the proof of (23), though a somewhat tedious case comparison is required.

Remark 1.7. *Many fine results on the location and distribution of the zeros of the polynomials* $P_n(z)$ *follow from Theorem 1.5(a). For instance:*

(a) *For every compact* $K \subset \Omega_\rho$ *there is a number* N_K *such that if* $n \geq N_K$*, then* $P_n(z)$ *has no zeros on* K*, and this is also true for any compact* $K \subset \overline{\Omega}_\rho \setminus \{a_1, \ldots, a_s\}$ *whenever* $\lambda_1 < 1$*;*

(b) *For every compact* $K \subset G_\rho$ *there is a number* N_K *such that if* $n \geq N_K$*, then* $P_n(z)$ *has at most* $u - 1$ *zeros on* K*, counting multiplicities.*

(c) *Let* $\mathcal{Z}$ *be the set of those points* $t \in \overline{\mathbb{C}}$ *such that every neighborhood of* t *contains zeros of infinitely many polynomials* $P_n(z)$*. Then,* $\overline{\Omega}_\rho \cap \mathcal{Z} = L_\rho$*.*

(d) $\mathcal{Z} \cap G_\rho$ *consists of those points* $t \in G_\rho$ *satisfying an equation of the form*

$$\sum_{k=1}^{u} \alpha_k \Delta_i(a_k) W(a_k, t) e^{i\theta_k} = 0,$$

with angles $\theta_1, \ldots, \theta_u$ *for which it is possible to find a subsequence* $\{n_j\}_{j\geq 1} \subset \mathbb{N}$ *such that*

$$e^{i\theta_k} = \lim_{j\to\infty} e^{i(n_j+1)\Theta_k}, \quad 1 \leq k \leq u. \tag{24}$$

(e) *For each* $n \geq 1$*, let* μ_n *be the normalized counting measure of the zeros* $z_{n,1}, z_{n,2}, \ldots, z_{n,n}$ *of* P_n*, that is,* $\mu_n := n^{-1}\sum_{k=1}^{n} \delta_{z_{n,k}}$*, where* δ_z *denotes the Dirac unit point measure at* z*. Let* μ_{L_ρ} *be the* equilibrium measure *of the compact set* L_ρ*, whose value at any given Borel set* $B \subset L_\rho$ *is*

$$\mu_{L_\rho}(B) := \frac{1}{2\pi\rho}\int_{\phi(B)} |dt|. \tag{25}$$

Then, the sequence $\{\mu_n\}_{n\geq 1}$ *converges in the weak*-topology to* μ_{L_ρ}*, i.e., for every continuous function* f *defined on* $\overline{\mathbb{C}}$*,* $\lim_{n\to\infty}\int f d\mu_n = \int f d\mu_{L_\rho}$*.*

Moreover, a result similar to Theorem 4 of [7] *(see also Theorems 11.1 and 11.2 of* [16]*) on the separation and speed of convergence to* L_ρ *of the zeros of* P_n *can be also obtained from (22).*

Statement (a) actually follows straightforwardly from (22) and the maximum modulus principle, while (b) and (d) are also easy if one gets help from Hurwitz theorem. Which u-tuples $\{\theta_1, \ldots, \theta_u\}$ satisfy (24) depends on the specific values of the angles Θ_k and can be characterized as it has been done in [18, Thm. 5], [7, Prop. 3] (or, if more details are needed, see [8, Sec. 2.2]). Statement (c) is a clear consequence of (e), given that, by definition (25), the support of μ_{L_ρ} is L_ρ. The proof of (e) is based on standard arguments of logarithmic potential theory: by (a), (b) and (14), any measure μ that is the weak*-limit of some subsequence $\{\mu_{n_j}\}_{j\geq 1}$ is supported on L_ρ and satisfies

$$\int \log\frac{1}{|z-t|} d\mu(t) = \int \lim_{j\to\infty} \log\frac{1}{|z-t|} d\mu_{n_j}(t) = \lim_{j\to\infty} n_j{}^{-1}\log|P_{n_j}(z)|^{-1} = \log|\phi'(\infty)/\phi(z)|, \quad z \in \Omega_\rho.$$

On the other hand, it is not difficult to verify from (25) that

$$\int \log\frac{1}{|z-t|} d\mu_{L_\rho}(t) = \log|\phi'(\infty)/\phi(z)|, \quad z \in \Omega_\rho,$$

i.e., the logarithmic potential of μ coincides outside L_ρ with that of μ_{L_ρ}, which, by a well-known theorem of Carleson [15, Thm. 4.13], implies that $\mu = \mu_{L_\rho}$.

Remark 1.8. *Values of $\lambda_k \in \{0, -1, -2, \ldots\}$ are purposely excluded because their corresponding factors $(z-a_k)^{\lambda_k}$ would not create a singularity (but a zero) for $\Delta_e(z)$ at a_k, and therefore, these factors may be simply regarded as being part of the function $h(z)$. We also note that among the weights defined by (17) are those of the form*

$$h(z) := |\omega_1(z)|^{-2} \prod_{k=1}^{s} |z-a_k|^{2\lambda_k}, \quad \{a_1, a_2, \ldots, a_s\} \subset L_\rho \cup L_{1/\rho},$$

with $\omega_1(z)$ an analytic function on $\overline{\Omega}_\rho$ that is never zero on $\overline{\Omega}_1 \cup \{a_k \in L_\rho\} \cup \{a_k^* : a_k \in L_{1/\rho}\}$ (here a_k^* denotes the Schwarz reflection of a_k about L_1). For in such a case, $h(z)$ can be also written in the form (17) as follows:

$$h(z) = |\omega(z)|^{-2} \left(\prod_{k\,:\,a_k \in L_\rho} |z-a_k|^{2\lambda_k} \right) \left(\prod_{k\,:\,a_k \in L_{1/\rho}} |z-a_k^*|^{2\lambda_k} \right), \quad z \in L_1,$$

with

$$\omega(z) = \omega_1(z) \prod_{k\,:\,a_k \in L_{1/\rho}} |\phi(a_k)|^{\lambda_k} \left(\frac{\phi(z)-\phi(a_k^*)}{z-a_k^*} \cdot \frac{z-a_k}{\phi(z)-\phi(a_k)} \right)^{\lambda_k}.$$

2. Proofs

Proof of Theorem 1.1. Let us denote by $H_n(z)$ the right-hand side of (10), which is originally defined on $\overline{\mathbb{C}} \setminus (L_r \cup L_{1/r})$, and let us prove that $H_n(z)$ is indeed an entire function.

Let

$$H_n^+(z) := \Delta_e(z)\sqrt{\phi'(z)}\,[\phi(z)]^n \left[1 + \sum_{k=0}^{\infty} \frac{1}{2\pi i} \oint_{L_1} \frac{f_n^{(2k+1)}(\zeta)\sqrt{\phi'(\zeta)}\,[\phi(\zeta)]^{-n} d\zeta}{\Delta_e(\zeta)\Delta_i(\zeta)[\phi(\zeta)-\phi(z)]} \right], \quad z \in \Omega_1, \tag{26}$$

which, in view of (7), is well-defined and analytic on Ω_1. This function provides the analytic continuation of $H_n|_{\Omega_{1/r}}$ to Ω_1, which follows from the very definition of $H_n|_{\Omega_{1/r}}$, given that for all $k \geq 0$ and $z \in \Omega_{1/r}$ (and by deforming $L_{1/r}$ into L_1),

$$f_n^{(2k+2)}(z) := \frac{1}{2\pi i} \oint_{L_{1/r}} \frac{f_n^{(2k+1)}(\zeta)\sqrt{\phi'(\zeta)}\,[\phi(\zeta)]^{-n} d\zeta}{\Delta_e(\zeta)\Delta_i(\zeta)[\phi(\zeta)-\phi(z)]} = \frac{1}{2\pi i} \oint_{L_1} \frac{f_n^{(2k+1)}(\zeta)\sqrt{\phi'(\zeta)}\,[\phi(\zeta)]^{-n} d\zeta}{\Delta_e(\zeta)\Delta_i(\zeta)[\phi(\zeta)-\phi(z)]}.$$

Moreover, by the residue theorem (deforming L_1 back into $L_{1/r}$ in (26)), we find that for every $z \in \Omega_1 \cap G_{1/r}$,

$$H_n^+(z) = \Delta_e(z)\sqrt{\phi'(z)}\,[\phi(z)]^n \left[1 + \sum_{k=0}^{\infty} \frac{1}{2\pi i} \oint_{L_{1/r}} \frac{f_n^{(2k+1)}(\zeta)\sqrt{\phi'(\zeta)}\,[\phi(\zeta)]^{-n} d\zeta}{\Delta_e(\zeta)\Delta_i(\zeta)[\phi(\zeta)-\phi(z)]} \right] - \frac{1}{\Delta_i(z)} \sum_{k=0}^{\infty} f_n^{(2k+1)}(z),$$

that is, the analytic continuation H_n^+ of $H_n|_{\Omega_{1/r}}$ to Ω_1 coincides for values of $z \in \Omega_1 \cap G_{1/r}$ with $H_n|_{\Omega_r \cap G_{1/r}}$ as defined by (10).

Similarly,

$$H_n^-(z) := \frac{1}{\Delta_i(z)} \sum_{k=0}^{\infty} \frac{1}{2\pi i} \oint_{L_1} f_n^{(2k)}(\zeta)\Delta_e(\zeta)\Delta_i(\zeta)W(\zeta,z)\sqrt{\phi'(\zeta)}\,[\phi(\zeta)]^n d\zeta, \quad z \in G_1,$$

provides the analytic continuation of $H_n|_{G_r}$ to G_1, which for values of $z \in \Omega_r \cap G_1$ coincides precisely with $H_n|_{\Omega_r \cap G_{1/r}}$.

Thus, $H_n(z)$ is an entire function and

$$\begin{aligned} \lim_{z\to\infty} \frac{H_n(z)}{z^n} &= \Delta_e(\infty)[\phi'(\infty)]^{n+1/2} \left(1 + f_n^{(2)}(\infty) + f_n^{(4)}(\infty) + \cdots + f_n^{(2k)}(\infty) + \cdots \right) \\ &= \Delta_e(\infty)[\phi'(\infty)]^{n+1/2}. \end{aligned}$$

By Liouville's theorem, $H_n(z)$ is a polynomial of exact degree n, whose leading coefficient is

$$\Delta_e(\infty)[\phi'(\infty)]^{n+1/2}.$$

Now, from the definition of $H_n|_{\Omega_r\cap G_{1/r}}$ we have

$$\begin{aligned}\frac{1}{2\pi}\oint_{L_1} H_n(z)\overline{z^m}h(z)|dz| &= \sum_{k=0}^{\infty}\frac{1}{2\pi}\oint_{L_1}\sqrt{\phi'(z)}\,[\phi(z)]^n\overline{z^m}f_n^{(2k)}(z)\Delta_e(z)h(z)|dz|\\ &\quad -\sum_{k=0}^{\infty}\frac{1}{2\pi}\oint_{L_1} f_n^{(2k+1)}(z)\overline{z^m}\Delta_i(z)^{-1}h(z)|dz|,\end{aligned}$$

so that Theorem 1.1 will follow at once if we show that

$$\begin{aligned}&\frac{1}{2\pi}\oint_{L_1}\sqrt{\phi'(z)}\,[\phi(z)]^n\overline{z^m}f_n^{(2k)}(z)\Delta_e(z)h(z)|dz|\\ &= \begin{cases} 0, & 0\le m<n,\ k\ge 0,\\ \Delta_e(\infty)^{-1}[\phi'(\infty)]^{-n-1/2}, & m=n,\ k=0,\\ \dfrac{\Delta_e(\infty)^{-1}[\phi'(\infty)]^{-n-1/2}}{2\pi i}\displaystyle\oint_{L_{1/r}}\dfrac{f_n^{(2k-1)}(\zeta)\sqrt{\phi'(\zeta)}[\phi(\zeta)]^{-n-1}d\zeta}{\Delta_e(\zeta)\Delta_i(\zeta)}, & m=n,\ k\ge 1,\end{cases}\end{aligned} \tag{27}$$

and

$$\frac{1}{2\pi}\oint_{L_1} f_n^{(2k+1)}(z)\overline{z^m}\Delta_i(z)^{-1}h(z)|dz| = 0,\quad n,m\ge 0,\quad k\ge 0. \tag{28}$$

First, we obtain by making the change of variables $z=\psi(w)$ that for all $0\le m\le n$,

$$\frac{1}{2\pi}\oint_{L_1}\sqrt{\phi'(z)}\,[\phi(z)]^n\overline{z^m}f_n^{(2k)}(z)\Delta_e(z)h(z)|dz| = \frac{1}{2\pi}\oint_{\mathbb{T}_1}\overline{\left[\frac{\sqrt{\psi'(w)}[\psi(w)]^m}{\Delta_e(\psi(w))}\right]}w^n f_n^{(2k)}(\psi(w))|dw|, \tag{29}$$

where we have used that for $z\in L_1$, $h(z)=|\Delta_e(z)|^{-2}$.

Now, the function $\sqrt{\psi'(w)}[\psi(w)]^m/\Delta_e(\psi(w))$ is analytic on $\overline{\mathbb{E}}_1\setminus\{\infty\}$ with a pole of order m at ∞, so that from its Laurent expansion at infinity we obtain that for certain coefficients a_j (that depend on n and m),

$$\overline{\left[\frac{\sqrt{\psi'(w)}[\psi(w)]^m}{\Delta_e(\psi(w))}\right]}w^n = \Delta_e(\infty)^{-1}[\phi'(\infty)]^{-m-1/2}w^{n-m}\left(1+\sum_{j=1}^{\infty}a_jw^j\right),\quad w\in\mathbb{T}_1. \tag{30}$$

On the other hand, from the definition of $f_n^{(2k)}(z)$ for $k\ge 1$ we see that

$$\begin{aligned}f_n^{(2k)}(\psi(w)) &= \frac{1}{2\pi i}\oint_{L_{1/r}}\frac{f_n^{(2k-1)}(\zeta)\sqrt{\phi'(\zeta)}[\phi(\zeta)]^{-n}d\zeta}{\Delta_e(\zeta)\Delta_i(\zeta)[\phi(\zeta)-w]}\\ &= \frac{1}{2\pi i}\oint_{\mathbb{T}_{1/r}}\frac{f_n^{(2k-1)}(\psi(t))t^{-n}\sqrt{\psi'(t)}dt}{\Delta_e(\psi(t))\Delta_i(\psi(t))(t-w)},\quad w\in\mathbb{E}_\rho\setminus\mathbb{T}_{1/r},\end{aligned}$$

is indeed analytic in all of $\overline{\mathbb{C}}\setminus\mathbb{T}_{1/r}$, and we obtain from its Taylor expansion about 0 that for certain coefficients b_j (that depend on n and k),

$$f_n^{(2k)}(\psi(w)) = \frac{1}{2\pi i}\oint_{L_{1/r}}\frac{f_n^{(2k-1)}(\zeta)\sqrt{\phi'(\zeta)}[\phi(\zeta)]^{-n-1}d\zeta}{\Delta_e(\zeta)\Delta_i(\zeta)} + \sum_{j=1}^{\infty}b_jw^j\,,\quad w\in\mathbb{T}_1. \tag{31}$$

Taking into account that $f_n^{(0)}(z)\equiv 1$, we then get (27) by combining (29), (30) and (31).

Similarly, if φ is a conformal map of G_1 onto $\mathbb{D}_1$ and $\delta(w)$ is its inverse, we have

$$\frac{1}{2\pi}\oint_{L_1} f_n^{(2k+1)}(z)\overline{z^m}\Delta_i(z)^{-1}h(z)|dz| = \frac{1}{2\pi}\oint_{\mathbb{T}_1} f_n^{(2k+1)}(\delta(w))\sqrt{\delta'(w)}\,\overline{\sqrt{\delta'(w)}[\delta(w)]^m\Delta_i(\delta(w))}|dw|, \tag{32}$$

where we have used that for $z\in L_1$, $h(z)=|\Delta_i(z)|^2$.

On the one hand, $\sqrt{\delta'(w)}[\delta(w)]^m\Delta_i(\delta(w))$ is analytic on $\overline{\mathbb{D}}_1$, and from its Taylor expansion we obtain

$$\overline{\sqrt{\delta'(w)}[\delta(w)]^m\Delta_i(\delta(w))} = \sum_{j=0}^{\infty} c_j w^{-j}, \quad w \in \mathbb{T}_1. \tag{33}$$

On the other hand, from the definition of $f_n^{(2k+1)}(z)$ and (6) we have that

$$f_n^{(2k+1)}(\delta(w))\sqrt{\delta'(w)} = -\frac{1}{2\pi i}\oint_{L_r}\frac{f_n^{(2k)}(\zeta)\Delta_e(\zeta)\Delta_i(\zeta)\sqrt{\varphi'(\zeta)}\sqrt{\phi'(\zeta)}\,[\phi(\zeta)]^n d\zeta}{\varphi(\zeta)-w}$$

is analytic on $\overline{\mathbb{C}}\setminus\varphi(L_r)\supset\overline{\mathbb{E}}_1$ and vanishes at ∞, so that its Laurent expansion at ∞ restricted to $\mathbb{T}_1$ is of the form

$$f_n^{(2k+1)}(\delta(w))\sqrt{\delta'(w)} = \sum_{j=1}^{\infty} d_j w^{-j}, \quad w \in \mathbb{T}_1. \tag{34}$$

Thus, (28) follows by inserting (33) and (34) in (32). □

Proof of Theorem 1.2. Proceed just as in the proof of Theorem 1.1 above. □

Proof of Corollary 1.4. Let r_1 and r be such that $\rho < r_1 < 1/\rho$, $\rho < r < \min\{r_1, r_1^{-1}\}$, so that $L_{r_1} \subset G_{1/r}\cap\Omega_r$.

By inequalities (7) and (8), we see that

$$\sum_{k=1}^{\infty}\left|f_n^{(2k+1)}(z)\right| \le r^{3n+1}\frac{\Lambda_r^2\Lambda_r' M_r \max_{(\zeta,z)\in L_r\times L_{r_1}}|W(\zeta,z)|}{1/r - r - \Lambda_r\Lambda_r' M_r r^{2n}}, \quad z \in L_{r_1},$$

$$\sum_{k=0}^{\infty}\left|f_n^{(2k+2)}(z)\right| \le r^{2n}\frac{(1/r-r)\Lambda_r\Lambda_r' M_r}{(1/r-r_1)(1/r - r - \Lambda_r\Lambda_r' M_r r^{2n})}, \quad z \in L_{r_1},$$

and we obtain from Theorem 1.1 that

$$\frac{\Delta_e(\infty)P_n(z)}{[\phi'(\infty)]^{-n-1/2}} = \Delta_e(z)\sqrt{\phi'(z)}\,[\phi(z)]^n - \Delta_i(z)^{-1}f_n^{(1)}(z) + \mathcal{O}\left(r_1^n r^{2n}\right), \quad z \in L_{r_1}. \tag{35}$$

Given that, again by (7), $f_n^{(1)}(z) = \mathcal{O}(r^n)$ uniformly in $z \in L_{r_1}$ as $n \to \infty$, we get from (35) that (14) holds uniformly in $z \in L_{r_1}$, and by the maximum modulus principle for analytic functions, it also holds on $\overline{\Omega}_{r_1}$.

If now $r_1 < 1$, then from the definition of $f_n^{(1)}(z)$ and the residue theorem we obtain that for all $z \in L_{r_1}$,

$$\begin{aligned} f_n^{(1)}(z) &= -\frac{\Delta_i(z)^{-1}}{2\pi i}\oint_{L_r}\Delta_e(\zeta)\Delta_i(\zeta)W(\zeta,z)\sqrt{\phi'(\zeta)}\,[\phi(\zeta)]^n d\zeta \\ &= \Delta_e(z)\sqrt{\phi'(z)}\,[\phi(z)]^n - \frac{\Delta_i(z)^{-1}}{2\pi i}\oint_{L_1}\Delta_e(\zeta)\Delta_i(\zeta)W(\zeta,z)\sqrt{\phi'(\zeta)}\,[\phi(\zeta)]^n d\zeta, \end{aligned}$$

which together with (35) yields that (15) holds for $z \in L_{r_1}$, and again by the maximum modulus principle for analytic functions, it also holds on $\overline{G}_{r_1}$.

Equality (13) follows, for instance, from (11) and (7), or from (12). □

Proof of Theorem 1.5. We first prove a proposition that will help the proof of Theorem 1.5 to go through smoothly. The following notation will be used. For each $\delta > 0$ and $t \in \mathbb{C}$,

$$D_\delta(t) := \{w : |w-t| < \delta\}, \quad T_\delta(t) := \{w : |w-t| = \delta\} = \partial D_\delta(t).$$

Let $0 < \sigma < \rho$ be given numbers, and define $\delta := \rho - \sigma$. Suppose that $v(t,z)$ is a function of two complex variables that is analytic in the variable t on the closed disk $\overline{D_{2\delta}(\rho)}$ for each $z \in E$ (E certain set), and that

$$\sup\left\{|v(t,z)| : (t,z) \in \overline{D_{2\delta}(\rho)} \times E\right\} < \infty,$$

so that, by the Cauchy integral formula, we also have that for every integer $p \ge 0$, there is a constant $0 < M_p < \infty$ such that

$$|\partial^p v(t,z)/\partial t^p| \le M_p, \quad (t,z) \in \overline{D_\delta(\rho)} \times E.$$

For $\beta \in \mathbb{R} \setminus \{0, -1, -2, \ldots\}$, let the function $(t-\rho)^{-\beta}$ be defined for $t \in \mathbb{C} \setminus (-\infty, \rho]$ according to the branch of the argument

$$-\pi < \arg(t-\rho) < \pi\,, \quad t \in \mathbb{C} \setminus (-\infty, \rho],$$

and let

$$(t-\rho)_-^{-\beta} := \lim_{z\to t,\, \Im z>0} (z-\rho)^{-\beta}, \quad (t-\rho)_+^{-\beta} := \lim_{z\to t,\, \Im z<0} (z-\rho)^{-\beta}, \quad t \in \mathbb{C} \setminus (-\infty, \rho],$$

denote its boundary values from either side of the semi-line $(-\infty, \rho]$.

Proposition 2.1. *With the notations above, and for every integer $n \geq 0$, we have*

$$I := \frac{1}{2\pi i} \oint_{T_\delta(\rho)} (t-\rho)^{-\beta} t^n v(t,z)dt = \binom{n}{\beta-1} v(\rho, z)\rho^{n-\beta+1} + \left\{ \begin{array}{ll} 0, & \textit{if } \beta = 1, \\ \mathcal{O}\left(n^{\beta-2}\rho^n\right), & \textit{if } \beta \neq 1, \end{array} \right. \tag{36}$$

uniformly in $z \in E$ as $n \to \infty$.

To prove the proposition, we first observe that for every integer $p \geq 0$,

$$\begin{aligned} \frac{\partial^p\left[v(t,z)t^n\right]}{\partial t^p} &= \sum_{j=0}^{p} \binom{p}{j} \frac{\partial^{p-j} v(t,z)}{\partial t^{p-j}} t^{n-j} \prod_{v=1}^{j}(n+1-v) = \frac{n!\, t^{n-p} v(t,z)}{\Gamma(n+1-p)} + \left\{ \begin{array}{ll} 0, & \text{if } p = 0, \\ \mathcal{O}\left(n^{p-1}t^n\right), & \text{if } p > 0, \end{array} \right. \\ &= \mathcal{O}(n^p t^n) \end{aligned} \tag{37}$$

uniformly in $z \in E$ as $n \to \infty$.

Therefore, if β is a positive integer, then we obtain from the Cauchy integral formula and (37) that

$$I = \frac{1}{(\beta-1)!} \left.\frac{\partial^{\beta-1}\left[v(t,z)t^n\right]}{\partial t^{\beta-1}}\right|_{t=\rho} = \binom{n}{\beta-1} v(\rho,z)\rho^{n-\beta+1} + \left\{ \begin{array}{ll} 0, & \text{if } \beta = 1, \\ \mathcal{O}\left(n^{\beta-2}\rho^n\right), & \text{if } \beta > 1, \end{array} \right. \tag{38}$$

uniformly in $z \in E$ as $n \to \infty$.

Next, consider a β that is not an integer. Let $\bar\beta$ be the smallest *nonnegative* integer not less than β. Consecutive integrations by parts over $T_\delta(\rho)$ yield

$$\begin{aligned} I &= \frac{1}{2\pi i} \sum_{j=1}^{\bar\beta} \left.\frac{\partial^{j-1}}{\partial t^{j-1}}\left[v(t,z)t^n\right]\right|_{t=\sigma} \frac{(-1)^{j-1}}{\prod_{l=1}^{j}(l-\beta)} \left[(\sigma-\rho)_-^{j-\beta} - (\sigma-\rho)_+^{-\beta+j}\right] \\ &\quad + \frac{(-1)^{\bar\beta}}{2\pi i \prod_{l=1}^{\bar\beta}(l-\beta)} \oint_{T_\delta(\rho)} (t-\rho)^{\bar\beta-\beta} \frac{\partial^{\bar\beta}}{\partial t^{\bar\beta}}\left[v(t,z)t^n\right]dt\,. \end{aligned} \tag{39}$$

We can now deform $T_\delta(\rho)$ into the two-sided segment $[\sigma, \rho]$ without altering the value of this last integral, and so obtain from (39) and (37) that

$$\begin{aligned} I &= \frac{1}{2\pi i \prod_{l=1}^{\bar\beta}(\beta-l)} \int_\sigma^\rho \left[(t-\rho)_+^{\bar\beta} - (t-\rho)_-^{\bar\beta-\beta}\right] \frac{\partial^{\bar\beta}\left[v(t,z)t^n\right]}{\partial t^{\bar\beta}} dt + \sum_{j=1}^{\bar\beta} \mathcal{O}\left(n^{j-1}\sigma^n\right) \\ &= \frac{\sin(\pi(\beta-\bar\beta))n!\rho^{n-\beta+1}}{\pi\Gamma(n-\bar\beta+1)\prod_{l=1}^{\bar\beta}(\beta-l)} \int_{\sigma/\rho}^{1} (1-x)^{\bar\beta-\beta} x^{n-\bar\beta}\left[v(\rho x, z) + \mathcal{O}\left(n^{-1}\right)\right]dx + \mathcal{O}\left(n^{\bar\beta-1}\sigma^n\right). \end{aligned} \tag{40}$$

On the one hand, there is some constant $M_1 > 0$ such that

$$|v(t,z) - v(\rho,z)| \leq \left|\int_{[\rho,t]} \frac{\partial v(w,z)}{\partial w} dw\right| \leq M_1|t-\rho|, \quad (t,z) \in \overline{D_\delta(\rho)} \times E. \tag{41}$$

On the other hand, for every integer $n \geq 0$ and real $\alpha > -1$, we have

$$\begin{aligned} \int_{\sigma/\rho}^{1} (1-x)^\alpha x^n dx &= \int_0^1 (1-x)^\alpha x^n dx - \int_0^{\sigma/\rho} (1-x)^\alpha x^n dx \\ &= \frac{\Gamma(\alpha+1)\Gamma(n+1)}{\Gamma(n+\alpha+2)} + \mathcal{O}\left(n^{-1}(\sigma/\rho)^n\right) = \frac{\Gamma(\alpha+1)(1+o(1))}{n^{\alpha+1}} \qquad (n\to\infty), \end{aligned}$$

so that by (41),

$$\begin{aligned}
&\int_{\sigma/\rho}^{1}(1-x)^{\bar{\beta}-\beta}x^{n-\bar{\beta}}\left[v(\rho x,z)+\mathcal{O}\left(n^{-1}\right)\right]dx\\
= \ & v(\rho,z)\int_{\sigma/\rho}^{1}(1-x)^{\bar{\beta}-\beta}x^{n-\bar{\beta}}dx+n^{-1}\int_{\sigma/\rho}^{1}\mathcal{O}\left((1-x)^{\bar{\beta}-\beta}x^{n-\bar{\beta}}\right)dx+\int_{\sigma/\rho}^{1}\mathcal{O}\left((1-x)^{1+\bar{\beta}-\beta}x^{n-\bar{\beta}}\right)dx\\
= \ & \frac{\Gamma(\bar{\beta}-\beta+1)\Gamma(n-\bar{\beta}+1)v(\rho,z)}{\Gamma(n-\beta+2)}+\mathcal{O}\left(n^{-\bar{\beta}+\beta-2}\right)\qquad(n\to\infty). \qquad (42)
\end{aligned}$$

Then, from (40) and (42), and taking into account that

$$\Gamma(\beta-\bar{\beta})\Gamma(\bar{\beta}-\beta+1)=\frac{\pi}{\sin(\pi(\beta-\bar{\beta}))},\quad \Gamma(\beta-\bar{\beta})\prod_{l=1}^{\bar{\beta}}(\beta-l)=\Gamma(\beta),$$

we obtain that (36) also holds if β is not an integer.

Having proven the proposition above, it is now easy to prove Theorem 1.5. Let us start by fixing a number σ with $\widehat{\rho}<\sigma<\rho$ and such that $\omega(z)$ is analytic on $\overline{\Omega}_\sigma$. Let the corresponding points ρ_k, σ_k $(1\le k\le s)$ and the sets Γ_σ and Σ_σ be defined as in (18)-(19).

Let $E\subset G_1\cap\Sigma_\sigma$ and $F\subset G_\sigma$ be compact sets, and let $\rho<r_1<1$ be such that $E\subset\overline{G}_{r_1}$. Then, according to (15), we have that for all $z\in\overline{G}_{r_1}\supset E\cup F\cup\{a_1,\dots,a_s\}$,

$$\frac{\Delta_e(\infty)P_n(z)}{[\phi'(\infty)]^{-n-1/2}}=\frac{\Delta_i(z)^{-1}}{2\pi i}\oint_{\mathbb{T}_1}\Delta_e(\psi(t))\Delta_i(\psi(w))W(\psi(w),z)\sqrt{\psi'(w)}\,w^n dw+\mathcal{O}\left(r_1^n\rho^{3n/2}\right). \qquad (43)$$

Choose $\widehat{\sigma}$ such that $\sigma<\widehat{\sigma}<\rho$, and if $\delta:=\rho-\widehat{\sigma}$, then the closed disks $\overline{D_{2\delta}(\rho_k)}$, $1\le k\le s$, are pairwise disjoint, and

$$\overline{D_{2\delta}(\rho_k)}\subset\mathbb{D}_1\cap\mathbb{E}_\sigma\setminus\{\phi(z):z\in E\},\quad 1\le k\le s.$$

Define

$$\widehat{\sigma}_k:=\widehat{\sigma}e^{i\Theta_k},\quad 1\le k\le s,$$

and the positively oriented contour

$$\mathcal{C}_{\widehat{\sigma}}:=\mathbb{T}_\sigma\cup\left(\cup_{\lambda_k\notin\mathbb{N}}[\sigma_k,\widehat{\sigma}_k]\right)\cup\left(\cup_{k=1}^{s}T_\delta(\rho_k)\right),$$

where each segment $[\sigma_k,\widehat{\sigma}_k]$ is viewed as having two sides.

Since $\omega(z)$ is analytic on $\overline{\Omega}_\sigma$ and

$$\Delta_e(\psi(w))=\omega(\psi(w))\prod_{k=1}^{s}\left(\frac{w}{w-\rho_k}\right)^{\lambda_k}\prod_{k=1}^{s}\left(\frac{w-\rho_k}{\psi(w)-\psi(\rho_k)}\right)^{\lambda_k},\quad w\in\mathbb{E}_\sigma\setminus\Gamma_\sigma, \qquad (44)$$

we have that for all $z\in E\cup F\cup\{a_1,a_2,\dots,a_s\}$, the function (in the variable w)

$$F(w,z):=\Delta_e(\psi(w))\Delta_i(\psi(w))W(\psi(w),z)\sqrt{\psi'(w)} \qquad (45)$$

is analytic on

$$\{w:\sigma<|w|<1\}\setminus\Gamma_\sigma$$

(with the exception of the point $\phi(z)$ in case $z\in E$, where it has a simple pole) with continuous boundary values on $\mathbb{T}_1\cup\Gamma_\sigma\setminus\{\rho_1,\rho_2,\dots,\rho_s\}$ when viewing each segment $[\sigma_k,\rho_k)$ as having two sides. Consequently, by deforming in (43) $\mathbb{T}_1$ into $\mathcal{C}_{\widehat{\sigma}}$ (and applying the residue theorem in case $z\in E$) we obtain that

$$\begin{aligned}
&\frac{\Delta_e(\infty)P_n(z)}{[\phi'(\infty)]^{-n-1/2}}-\begin{cases}\Delta_e(z)\sqrt{\phi'(z)}[\phi(z)]^n, & z\in E,\\ 0, & z\in F\cup\{a_1,a_2,\dots,a_s\},\end{cases}\\
= \ & \frac{\Delta_i(z)^{-1}}{2\pi i}\oint_{\mathcal{C}_{\widehat{\sigma}}}F(w,z)w^n dw+\mathcal{O}\left(r_1^n\rho^{3n/2}\right),\\
= \ & \Delta_i(z)^{-1}\sum_{k=1}^{s}\frac{1}{2\pi i}\oint_{T_\delta(\rho_k)}F(w,z)w^n dw+\mathcal{O}\left(\widehat{\sigma}^n\right)+\mathcal{O}\left(r_1^n\rho^{3n/2}\right),\quad z\in E\cup F\cup\{a_1,\dots,a_s\}. \quad (46)
\end{aligned}$$

If we now specify

$$-\pi < \arg(t-\rho) < \pi\,, \quad t \in \mathbb{C} \setminus (-\infty, \rho]\,, \tag{47}$$

$$-\pi < \arg(t) < \pi\,, \quad t \in \overline{D_{2\delta}(\rho)}, \tag{48}$$

we see from (44), (45) and (6) that for every $1 \leq k \leq s$,

$$F(te^{i\Theta_k}, z) = e^{-i\lambda_k \Theta_k} (t-\rho)^{-\lambda_k} F_k(t,z), \quad t \in \overline{D_\delta(\rho)} \setminus [\widehat{\sigma}, \rho], \quad z \in E \cup F \cup \{a_j : j \neq k\}$$

where $F_k(t,z)$ is analytic (as a function of t) on the closed disk $\overline{D_{2\delta}(\rho)}$ for every $z \in E \cup F \cup \{\rho_j : j \neq k\}$, and

$$F_k(\rho, z) = \rho_k^{\lambda_k} [\phi'(a_k)]^{\lambda_k - 1/2} \Delta_i(a_k) W(a_k, z) \lim_{z \to a_k} \left\{ \left(\frac{\phi(z)}{z - a_k} \right)^{-\lambda_k} \Delta_e(z) \right\}. \tag{49}$$

Hence we get from the proposition proven above that for every $z \in E \cup F \cup \{a_j : j \neq k\}$,

$$\begin{aligned} \frac{1}{2\pi i} \oint_{T_\delta(\rho_k)} F(w,z) w^n dw &= \frac{e^{i(n-\lambda_k+1)\Theta_k}}{2\pi i} \oint_{T_\delta(\rho)} (t-\rho)^{-\lambda_k} t^n F_k(t,z) dt \\ &= \binom{n}{\lambda_k - 1} F_k(\rho, z) \rho_k^{n-\lambda_k+1} + \begin{cases} 0, & \text{if } \lambda_k = 1, \\ \mathcal{O}\left(n^{\lambda_k - 2} \rho^n\right), & \text{if } \lambda_k \neq 1. \end{cases} \end{aligned} \tag{50}$$

Thus, part (a) of Theorem 1.5 follows from (46), (49) and (50).

Part (b) follows similarly. The function $W(\psi(w), a_j)$ is analytic in $\{w : \sigma < |w| < 1,\ w \neq \rho_j\}$, with a simple pole at ρ_j of residue $\phi'(a_j)$, and with the specifications (47) and (48), we have

$$F(te^{i\Theta_j}, a_j) = e^{-i(\lambda_j+1)\Theta_j} (t-\rho)^{-\lambda_j - 1} U_j(t), \quad t \in \overline{D_\delta(\rho)} \setminus [\widehat{\sigma}, \rho],$$

where $U_j(t)$ is analytic on $\overline{D_{2\delta}(\rho)}$ and

$$U_j(\rho) = \rho_j^{\lambda_j} [\phi'(a_j)]^{\lambda_j + 1/2} \Delta_i(a_j) \lim_{z \to a_j} \left\{ \left(\frac{\phi(z)}{z - a_j} \right)^{-\lambda_j} \Delta_e(z) \right\}, \tag{51}$$

so that

$$\begin{aligned} \frac{1}{2\pi i} \oint_{T_\delta(\rho_j)} F(w, a_j) w^n dw &= \frac{e^{i(n-\lambda_j)\Theta_j}}{2\pi i} \oint_{T_\delta(\rho)} (t-\rho)^{-\lambda_j - 1} t^n U_j(t) dt \\ &= \binom{n}{\lambda_j} U_j(\rho) \rho_j^{n-\lambda_j} + \mathcal{O}\left(n^{\lambda_j - 1} \rho^n\right), \end{aligned} \tag{52}$$

and part (b) of the theorem follows by combining (46), (50), (51) and (52). ☐
